CHECKS SUMMARY

['] 2 4 P A S S
[!] 8 WARN
['] 4 F A I L

Actionable Findings (6 detected)

FAIL

Cumulative Layout Shift Too High

0.42 (poor)

Elements shifted significantly while the page was loading. Large shifts disorient users, cause accidental clicks, and harm core web vitals rankings.

The Fix: Specify explicit width and height aspect ratios on all image, video, and iframe tags to reserve layout space before assets load.

FAIL

Missing Content-Security-Policy Header

header missing

The web server does not send a Content-Security-Policy (CSP) response header. Without CSP, the browser cannot defend against cross-site scripting (XSS) and malicious code injection.

The Fix: Configure your reverse proxy, CDN, or web server to return a strict Content-Security-Policy header restricting script and object sources.

WARN

Heavy Image Payloads Detected

2.4 MB total

Uncompressed images dominate initial page weight. On mobile 4G networks, this increases First Contentful Paint by up to 2.1 seconds.

The Fix: Convert PNG and JPEG images to WebP/AVIF formats and configure lazy-loading (loading="lazy") on images below the viewport.

WARN

Short Meta Description Tag

42 characters

The meta description is too brief to provide an enticing snippet in search engine results pages.

The Fix: Expand the description to 120-155 characters summarizing the page value proposition with clear search keywords.

WARN**HSTS Header Missing Max-Age Preload****partial HSTS**

Strict-Transport-Security is enabled but lacks the includeSubDomains and preload directives required for HSTS browser preloading.

The Fix: Update Strict-Transport-Security to: max-age=63072000; includeSubDomains; preload.

FAIL**Muted Text Contrast In Footer Links****3.2:1 ratio**

Footer navigation elements fail WCAG 2.1 AA minimum contrast requirements (minimum 4.5:1 required for body text).

The Fix: Darken secondary text color from #8C857A to at least #595349 against the light background.
